## 1.0 Introduction

AECOM Australia Pty Ltd (AECOM) (formerly ENSR Australia) has been commissioned by BHP Billiton (BHPB) to conduct long term kinetic tests on a selection of rock chip samples from Olympic Dam to support the studies associated with the proposed Olympic Dam Expansion (ODX). This report is a supplement to the Assessment of the Olympic Dam Mine Rock Geochemistry (see Appendix K5 of the Draft EIS).

The kinetic testing program is based on five samples from the overburden, six from the major basement host rocks, and five from the minor basement rock types. Samples were derived from drill core and stope samples and supplied by BHP Billiton. Samples were subjected to regular flushing and geochemical assay to predict metal and salt release rates under weathering conditions.

As reported in Appendix K5 of the Draft EIS, ENSR developed long term release rate estimates based on kinetic testing extending over a period of 64 weeks (15 months). The kinetic tests have continued since the preparation of that report and data now extends to 174 weeks (40 months). This report is a supplement to Appendix K5 of the Draft EIS and presents additional kinetic data for waste rock associated with the proposed Olympic Dam Expansion.

## 2.0 Methodology

### 2.1 Kinetic test design

As discussed in Appendix K5 of the Draft EIS, ENSR performed kinetic tests on 19 samples to determine the reactivity of the main rock units. A summary of the column source material is contained in **Table 1**.

**Table 1 Column sample source material**

Column ID	Rock Code	Source	Drill Hole	Sampling Interval (m)
OD_1	HEMH (148187)	Basement	UG1*	n / a
OD_2	GRNL (148207)	Basement	UG2*	n / a
OD_3	HEM (148194)	Basement	UG3*	n / a
OD_4	ZWAW	Overburden	RD2744	174-175
OD_5	ZWA	Overburden	RD2744	45-46
OD_6	ZWC	Overburden	RD2744	193-194
OD_7	ZWT	Overburden	RD2744	230-231
OD_8	ZWAR	Overburden	RD2744	103-104
OD_9	ZAL	Overburden	RD2744	24-25
OD_10	HEMQ	Basement	RD2741	793-794
OD_11	HEMH	Basement	RD1638	530-531
OD_12	GRNH	Basement	RD1625	583-594
OD_13	GRNB	Basement	RD2731	754-755
OD_14	GRNL	Basement	RD2730	719-720
OD_15	KASH	Basement	RD1638	651-652
OD_16	KASH Laminated	Basement	RD2748	582-586
OD_17	VHEM	Basement	RD2741	650-651
OD_18	KHEMQ-VASH	Basement	RD2748	730-731
D_19	CONGLO	Basement	RD1638	374-376

Mine rock collected underground: UG1\* = sample collected 10May06 from '32 Purple 311 EXT DRV' UG2\* = sample collected 11May06 from '39 LJ55 S / PILE'; UG3\* = sample collected 10May06 from '45 MJ55 STH PER'.

The leach columns used for the study were similar to those documented in AMIRA P387A ARD Test Handbook (AMIRA, 2002) and they are designed to measure relative reactivity of a given sample material, in this case the mine rock, under atmospheric oxygen concentrations that commonly occur in a RSF. **Figure 1** shows the schematic layout of the columns.

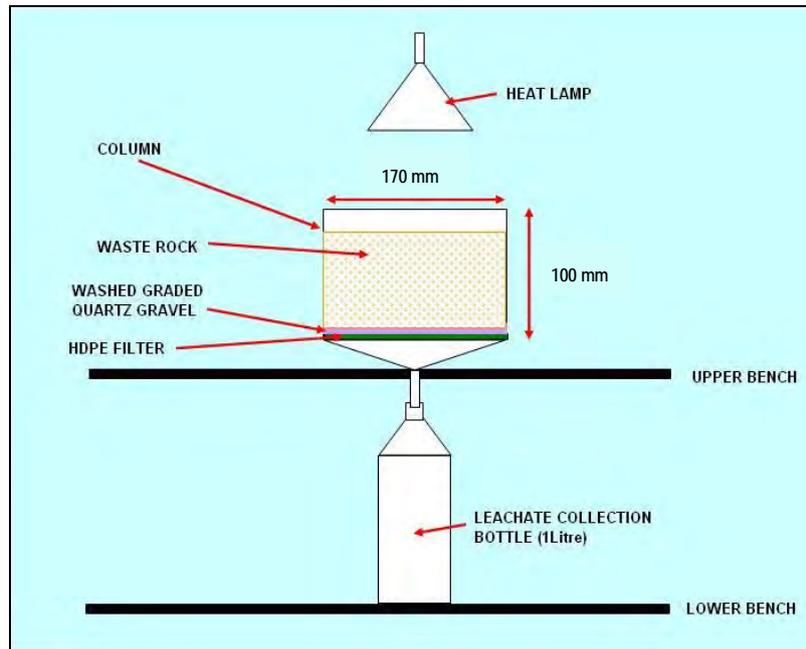

Figure 1 Free draining column configuration

The flushing frequency was modified at week 122 as a result of the declining salt production. A summary of the key program changes is provided in Table 2.

Table 2 Summary of major events in kinetic testing program

Period	Change
Week 0	Kinetic tests established (flushed monthly).
Week 16	Testing of cover rock types terminated due to low yields.
Week 17	Weekly flushing established for basement rock types.
Week 122	Flushing shifted from weekly to monthly intervals due to low yield.
Week 174	Total duration of testing as reported herein.

## 2.2 Leachate Analysis

Leachate from each column was analysed for the analytes listed in Table 3. The analytical testwork was undertaken at ALS Brisbane Laboratory, a NATA registered laboratory.

Table 3 Analytical program for kinetic testwork leachate

Analyte	Method Code	Detection Limit	Units of Reporting
pH	EA005P: pH by PC Titrator	0.01	pH unit
Electrical conductivity	EA010P: Electrical conductivity by PC Titrator	1	uS/cm
Total alkalinity	EP037P: Titrametric method	1	mg/L
Acidity	EP038: Titrametric method	1	mg/L
Na, K, Ca, Mg	ED093F: Major cations	1	mg/L
Al	EG020F: ICPMS on filtered solution	0.01	mg/L
Fe	EG005F: ICPAES on filtered solution	0.05	mg/L
Total P	EK067: APHA 4500-P H	0.01	mg/L
Si	ED040F: ICPAES on filtered solution	0.05	mg/L
SO4	ED040F: ICPAES on filtered solution	1	mg/L
Cl	ED045P: Titrametric Method	1	mg/L

Analyte	Method Code	Detection Limit	Units of Reporting
Rb, Cs, Be, Sr, Ba, Y, La, Ce, Th, U, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Ti, Zr, Hf, V, Cr, Mo, Mn, Co, Ni, Cu, Ag, Zn, Cd, Al, In, Tl, Ga, Sn, Pb, Sb, Bi, As, Se, Te	EG020F: ICPMS on filtered solution	0.001	mg/L

## 2.3 Production Rates

The production rate of metals and salts was determined at each flushing interval. The production rate is a function of the mass of sample, the interval over which salts and metals have accumulated, the flush volume and the chemistry of the flush water. This relationship is provided below:

$$\text{Production rate (mg/kg/week)} = \frac{\text{Concentration (mg/L)} \times \text{Rinse volume (L)}}{\text{Sample weight (kg)} \times \text{Rinse interval (week)}}$$

The production rates were plotted over the experiment duration for key analytes: pH, electrical conductivity, aluminium, barium, calcium, copper, magnesium, fluorine, sodium, potassium, iron, lead, magnesium, phosphorus, silicon, strontium chloride, sulfate, uranium, zinc, arsenic, nickel and alkalinity.

The adopted long-term production rate of each element was selected based on a review of the production trends to identify the stabilised production rate. The production rates observed in the early stages of kinetic testing (until week 25) were generally elevated due to flushing of salinity that was present as porewater at the time the samples were obtained, and flushing of accumulated weathering products that were generated subsequent to sampling but prior to testing. These initial elevated values, plus outliers, were excluded from the long-term production rate estimate.

## 3.0 Summary of sample geochemistry

A summary of metal enrichment in each lithology is provided in **Table 4**. Geochemical assays of kinetic sample material are provided in Appendix B.

**Table 4 Geochemical assay summaries**

Unit (number of samples)	General Comment	Geochemical Abundance Index*
<b>Overburden</b>		
Andamooka Limestone (ZAL) n=95	elevated Ca and Mg	
Arcoona Quartzite (ZWA, ZWAR, ZWAW) n=514	occasional elevated As, Cu, Mn, Mg, Mo, Ni, S, V,	
Corraberra Sandstone (ZWC) n=77	occasional elevated U	
Tregolana Shale (ZWT) n=469	elevated Fe, Cr, As, Co, Cu, Mn, Ni, S, U, V, Zn, Zr	Enriched in Sb
Pebble Conglomerate (ZWP) n=13	elevated Sb, As, Cu, Fe, Pb, Mn, Mo, S, U	Enriched in Sb, As, Mo
<b>Basement</b>		
Granites (GRN, GRNB, GRNH, GRNL) n~94,000	elevated Au, Ag, Ba, La, Ce, Cu, U, Al, Si, Mn, Ti, Co, Pb	Enriched in Au, Ag, Ba, Ce, Cu, La, Pb, U
Hematite granites (HEMH, HEM, HEMQ) n~20 000	elevated Cu, U, Au, Ag, Fe, Co, La, Ce, Zn,	Enriched in Au, Ag, Ba, Ce, Cu, Fe, La, U
Volcanics (EVB, HEMV, KASH, KHEMQ, VASH, VHEM) n=167	occasional elevated Ba, Ce, Cu, Fe, La, U, Pb	Enriched in Ba, Ce, Cu, La, U, Pb ; HEMV is also enriched in Fe

Notes: na – not analysed; \* in reference to crustal abundance

**Table 5** summarises the acid base accounting results for the column test material. The Maximum Potential Acidity (MPA) and Nett Acid Producing Potential (NAPP) expressed as kilograms of sulphuric acid per tonne were calculated from sulfide sulfur derived from the total sulfur concentration adjusted for the presence of barite in the sample material tested.

**Table 5 Summary of Acid Base Accounting for Column Test Material**

ANC - acid neutralising capacity; MPA – maximum potential acidity; NAPP – nett acid producing potential; NAG – nett acid generation

## 4.0 Results

Raw leachate data is presented in Appendix A. Release rates were determined for each mine rock unit. The release rates are calculated at each flush interval and therefore vary over time, and are presented in Appendix C.

### 4.1 Release rates

Average release rates over the full 174 week dataset are provided in Table 6. Results from the first 25 weeks of the test were discarded because this was primarily related to flushing of salinity that was present as porewater at the time the samples were obtained, and flushing of accumulated weathering products that were generated subsequent to sampling but prior to testing.

Average release rates from the data to Week 65 were used by ENSR (see Appendix K5 of the Draft EIS) to feed into a geochemical model to predict the changes in chemistry draining from the RSF. A comparison between release rates based on 65 weeks of data and the full 174 week dataset is also provided in Table 6. Release rates that have changed significantly since Week 65 are highlight. The green highlighting suggests a significant reduction in release, and red highlighting suggests a significant increase in release.

**Table 6 Release rates based on 174 weeks (g/t/week)**

Notes:

1. Colour code:	Definition
No significant change	less than +/-15% change OR more than 50% below LOR
Significant increase	more than +15% change AND less than 50% below LOR
Significant decrease	more than -15% change AND less than 50% below LOR

2. ^ indicates % change from Week 26-65 rates compared to rates based on the full dataset from Week 26-174

## 4.2 Trends by lithology

The results of the testwork indicate that all the columns have generated low acidity, alkalinity and sulfate concentrations in leachate. Most of the columns yield soluble salts with similar cation and anion composition to saline groundwater. A discussion based on each rock type is provided below.

### 4.2.1 Overburden

Kinetic tests of the overburden material has yielded negligible metals and sulfate in leachate compared to basement complex mine rock material, consistent with the low metal concentrations identified by the static test work. Refer to Appendix K5 of the Draft EIS for a summary of the kinetic testing of overburden rock types.

### 4.2.2 Granitic Material

Granitic material (GRNH, GRNB and GRNL) produces leachate with detectable concentrations of copper, molybdenum and uranium. There has been an increase in copper production over time, and appears to be continuing for most samples. There has also been a gradual reduction of pH throughout the kinetic testing program. The leachate water was initially alkaline and consistent with regional groundwater characteristics, and has reduced as the pore water was flushed and oxidation instigated. The GRNH sample (OD\_12) shows a reduction in sodium and chloride over the test duration, but an increase in sulfate, uranium and copper. This suggests possible oxidation of sulfides, releasing copper and causing a pH reduction that can also mobilise uranium. The pH trend over the testing program is presented in Figure 2.

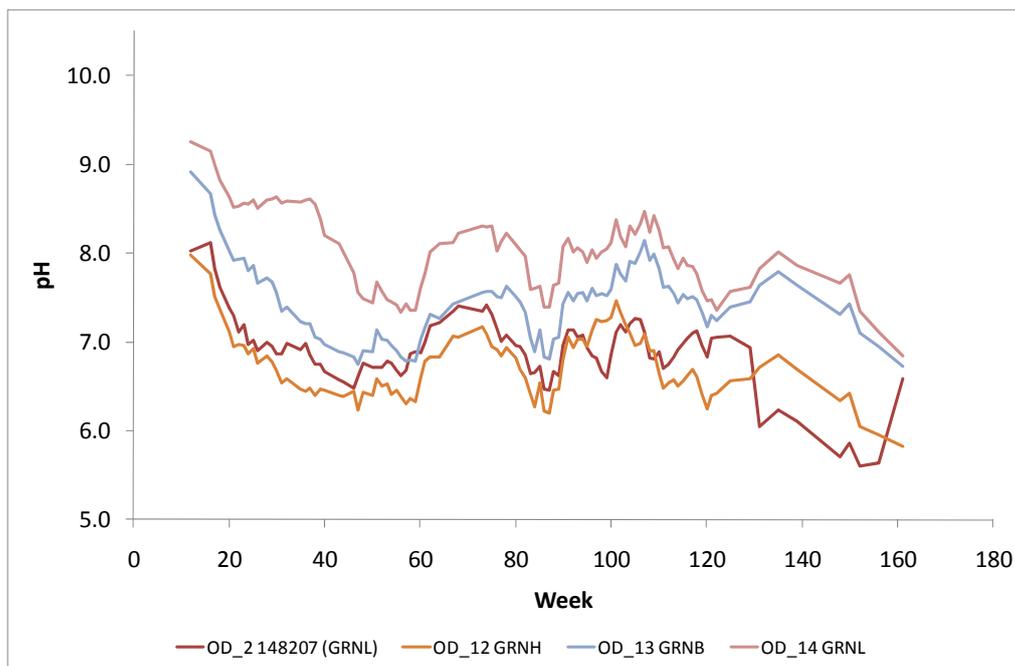

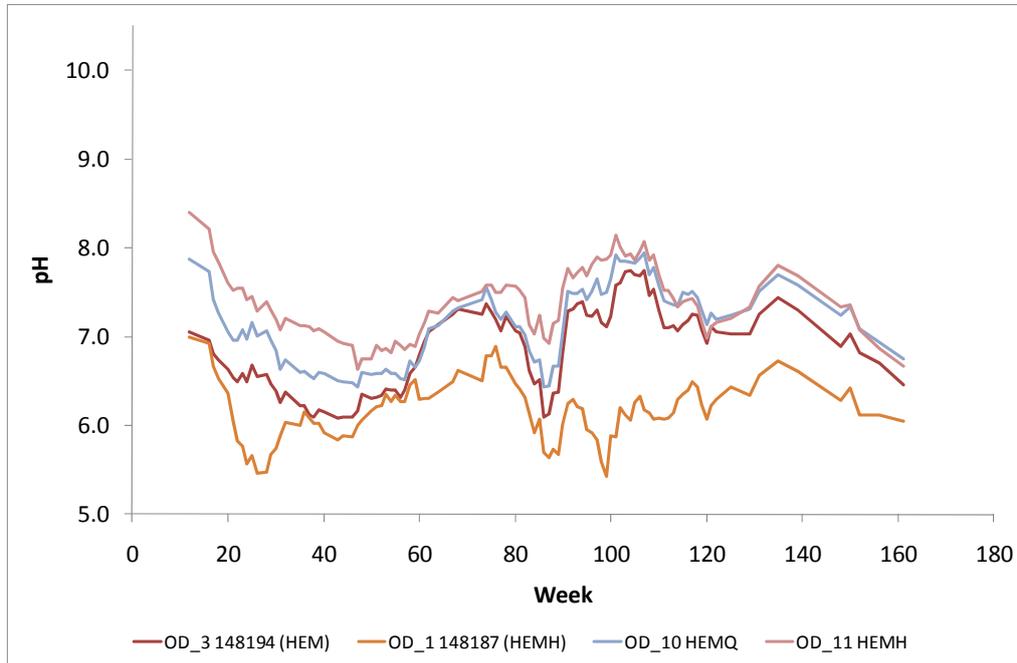

Figure 2 pH trends for Granitic lithologies

### 4.2.3 Haematitic Material

Haematitic material (HEM, HEMQ and HEMH) has produced leachate with detectable concentrations of arsenic, molybdenum and acidity. The haematites show a reduction in soluble salts, including sulfate, over the testing period. Copper and uranium release rates are generally low, the exception being HEMH (sample OD\_1 148187) which exhibits higher copper and sulfate release, with copper release increasing throughout the test period. The pH trends over the program are inconsistent and fluctuate between neutral and slightly acidic, as shown in Figure 3.

**Figure 3 pH trends for Haematitic lithologies**

**4.2.4 Volcanics and Epiclastics**

The volcanic and epiclastic material (KASH, VHEM, KHEMQ VASH and CONGLO) produce leachate with higher sulfate, aluminium, arsenic, copper, iron, manganese and zinc relative to other materials tested. There has been a reduction in concentrations throughout the testing program with a number of parameters now at steady state. Leachate from the volcanic rock material ranges from neutral to alkaline pH and has been consistent throughout the program, as shown in Figure 4.

**Figure 4 pH trends for Volcanic lithologies**

### 4.3 Steady state

The kinetic testing program has been ongoing for more than 3 years and steady state conditions have been realised for some analytes in some samples, however there are no samples that have conclusively reached steady state for all analytes. A qualitative assessment of whether steady state conditions have been achieved is provided in Table 7.

**Table 7 Assessment of whether results indicate steady state conditions have been achieved**

### 5.0 QA/QC

The QA / QC procedures utilised for the kinetic testwork are described in Appendix D.

Towards the latter part of the kinetic testing program ionic strengths reduced and a greater number of analytes were close to or below limits of reporting, which accounts for increased ionic balance discrepancies towards the end of the program. Overall, ionic balance checks identified that the laboratory data were considered acceptable. A summary of the key considerations in the QA/QC program is provided below:

- Completeness - All samples collected and analysed complied with the DQIs, as such the data obtained are considered to be sufficiently quantitative and complete for the purposes of this investigation (i.e. >95%)
- Comparability - The data obtained throughout the investigation are considered to be suitably comparable.
- Precision - The precision of the data are sufficient for the purposes of this investigation.
- Accuracy - The accuracy of the data are sufficient for the purposes of this investigation

### 6.0 Conclusion

A kinetic testing program has been undertaken for 174 weeks. The program involves a number of measurements over time, that are used to assess a range of acid drainage and metal leaching issues including sulfide reactivity, oxidation kinetics, metal solubility and the leaching behaviour of materials. Kinetic tests were performed on 19 samples to determine the reactivity of the main rock units present in the basement and overburden.

Samples were subjected to regular flushing (weekly to monthly) and geochemical assay to predict metal and salt release rates under weathering conditions.

The kinetic data indicate the following trends:

- overburden material produces minimal metal and acidity

- granitic material produces leachate with detectable concentrations of copper, molybdenum and uranium and suggests sulfide oxidation is occurring that may continue to release these metals at increasing rates
- haematitic altered material produces leachate with detectable concentrations of arsenic, molybdenum and acidity
- volcanic and epiclastic material produce leachate with higher sulfate, aluminium, arsenic, copper, iron, manganese and zinc relative to other materials tested.

## Appendix D

# QA/QC

## 1.0 Introduction

The following sections describe the components of the quality assurance and quality control procedures implemented for the kinetic testing. Quality assurance (QA) refers to the implementation of checks on the success of quality control (QC), which is largely concerned with maintaining the integrity of the sample. QA/QC protocols apply to both the sampling and the laboratory component.

## 2.0 Data Quality Indicators

Project data quality indicators (DQIs) have been established to ensure high quality sample collection and laboratory procedures (Table D-1).

**Table D-1: Data Quality Indicators for Sampling and Laboratory Analyses**

DQI	Sampling	Laboratory
Completeness	Experienced sampler Documentation Correct	All critical samples analysed Appropriate methods Sample documentation complete Sample holding times complied with standard procedures
Comparability	Experienced Sampler	Sample analytical methods used (including clean-up) Same NAT accredited laboratory Same units
Precision		Laboratory duplicate samples Laboratory control samples
Accuracy		Method blanks Matrix spikes Laboratory control samples

## 3.0 Sampling

### 3.1 Sampling Details

Leachate samples were collected weekly from week 16 (14 August 2006) to week 122 (15 to 19 December 2008), the exception being for the following weeks where no samples were collected:

- Week 65 and 66
- Week 69 to 72 (Christmas 2007 break)
- Week 79 ( 25 to 29 February 2008)

Leachate samples were then collected on a monthly basis from week 122 to week 174 (14 to 18 December 2009).

The sampling was undertaken by a qualified and experienced AECOM geoscientist or environmental technician.

### 3.2 Sample Handling and Preservation

Samples were suction filtered through 0.45 µm filters and were immediately placed into laboratory prepared and supplied sample containers appropriate for each analyte. The unpreserved bottles were filled so that no headspace remained. Samples for metals analysis were placed in nitric acid preserved bottles supplied by the laboratory.

Filled sample bottles were placed in a chilled, insulated container with ice for transport to the laboratory. Samples were preserved for the various analytes in accordance with the requirements of American Public Health Association (APHA, 2005) as detailed in the **Table D-2** below.

Table D-2: Data Quality Indicators for Sampling and Laboratory Analyses

Analytes	Container	Preservation
All metals	125 mL plastic bottle	Nitric Acid (HNO <sub>3</sub> ), chill to 4°C
Acidity, alkalinity, chloride, fluoride, pH, phosphorus, sulphate, silica	250 mL plastic bottle	Unpreserved, chill to 4°C

Samples codes, preservation and analytical requirements were recorded on the chain of custody (CoC) documentation (Figure D-1), which accompanied the samples to the laboratory.

Figure D-1: CoC form completed for all leachate data sets sent to the laboratory

### 3.3 Calibration

#### 3.3.1 Water Quality Meter

Measurement of leachate physio-chemical parameters was undertaken using a WP 81 TPS water quality meter. It was successfully calibrated with pH buffers 4.01 and 6.88, and electrical conductivity (EC) 2.76 mS/cm solution each time measurements were taken.

### 4.0 Laboratory QA/QC

The laboratory data review covered a total of 33 batches from week 103 (07 August 2008) to week 174 (17 December 2009)..

### 4.1 Analytical Laboratory

Samples were submitted to Australian Laboratory Services (ALS) in Stafford, Queensland.

The ALS NATA accreditation number is 825; its analytical procedures are based on well established internationally recognised procedures such as those published by APHA (2005) and National Environmental

Protection Measures (NEPM, 1999). In house procedures are employed by ALS in the absence of documented standards.

## 4.2 Analytical Methods

The analytical methods included physico-chemical measurements and chemical analysis of cations (major, minor and trace metals) and anions. Details are presented in

**Table D-3 Laboratory Method References**

Analyte	Reference	ALS Method Code	Limit of Reporting
pH	APHA 4500-H <sup>+</sup> B	EA005	0.01 (pH unit)
Electrical Conductivity	APHA 2510 B	EA010P	1 µS/cm
Total Alkalinity	APHA 2320 B	ED037P	1 mg/L
Acidity	APHA 2310 B	ED038A	1 mg/L
Silicon	APHA 3120	ED040F	0.05 mg/L
Sulfate	APHA 3120	ED040F	1 mg/L
Chloride	APHA 4500-Cl <sup>-</sup> - B	ED045P	1 mg/L

Al, Sb, As, Ba, Ce, Co, Cu, Fe, La, Pb, Mn, Mo, Ni, Sr, Th, U, Y, Zn	USEPA 6020 ICP/AES	EG020F	0.001 to 0.05 mg/L

## 4.3 Ionic Balance

Ionic balances were undertaken on all flush water results. Ionic balance checks were undertaken from week 103 to 174 and compared to the initial ionic balance checks.

Ionic strengths reduced from week 58 onwards and a greater number of analytes were close to or below the limits of reporting. This resulted in ionic balance discrepancies at the end of the program. Overall, ionic balance checks identified that the laboratory data were acceptable, with kinetic columns that represent major rock units (by mass) exhibiting a median error of 10-23%, which is considered acceptable as the results were close to or below the limits of reporting. **Table D-4** presents summary statistics of the ionic balance error.

**Table D-4: Ionic Balance Percent Error (median)**

Column	Week 0-64	Week 103-174
OD_1 148187 (HEMH)	0.5 %	38.5 %
OD_2 148208 (GNRL)	0.5 %	28.6 %

1. Bold values indicate samples representing significant mass within the RSF

#### 4.4 Laboratory Method Blanks

Laboratory or control blanks consist of reagents specific to each individual analytical method and are prepared and analysed by laboratories in the same manner as regular samples. The preparation and analysis of laboratory blanks enables the measurement of contamination within the laboratory.

Laboratory blanks were generally analysed at a frequency of 1 in 10, with a minimum of one analysed per batch.

Review of all the laboratory QA/QC reports indicated that the results for all method blanks were below the laboratory detection limit.

#### 4.5 Laboratory Duplicates

Laboratory duplicate samples are prepared in the laboratory by splitting a field sample and analysing it as two independent samples. The analysis of laboratory duplicate samples provides an indication of analytical precision and may be influenced by sample heterogeneity. The laboratory duplicate relative percent differences (RPDs) are used to assess laboratory precision.

Laboratory duplicates were generally analysed at a frequency of 1 in 10, with a minimum of one analysed per batch. Analysis frequency was not respected for the following week:

- Week 103: major anions and cations analyses – 3 duplicates analysed instead of 4; however on a batch basis (13 samples) ALS complies with the NEPM requirements.
- Week 105: chloride analysis - 3 duplicates analysed instead of 4; however on a batch basis (13 samples) ALS complies with the NEPM requirements.
- Week 113: chloride analysis – 2 duplicates analysed instead of 3, however on a batch basis (13 samples) ALS complies with the NEPM requirements.
- Week 114: pH analysis – 3 duplicates analysed instead of 4, however on a batch basis (13 samples) ALS complies with the NEPM requirements.
- Week 122: fluoride analysis – 1 duplicate analysed instead of 2 and on a batch basis (13 samples) ALS does not comply with the NEPM requirements.
- Week 148: fluoride analysis – 1 duplicate analysed instead of 2 and on a batch basis (13 samples) ALS does not comply with the NEPM requirements.

Review of all the laboratory QA/QC reports indicated that the RPDs for all laboratory duplicate samples ranged from 0 to 100 and were within the acceptance criteria.

The permitted ranges for the RPD of laboratory duplicates (relative percent deviation) are dependent on the magnitude of results in comparison to the level of reporting:

- result < 10 times limit of recovery (LOR), no limit
- result between 10 and 20 times LOR, 0% - 50%
- result > 20 times LOR, 0% - 20%

The non compliance with the frequency of analysis on two occasions out of 33 is considered acceptable and not to have an adverse impact on the data quality as the RPD results all fell within the acceptance criteria.

## 4.6 Laboratory Control Samples

Laboratory control samples (LCS) or quality control check samples are prepared within the laboratory by spiking an aliquot of an appropriate clean matrix reagent with known concentrations of specific analytes. The LCS sample is then analysed and the results are used to assess the laboratory performance on sample preparation and analysis procedure. Certified reference material may also be used to assess analytical accuracy independent of the investigations. Accuracy is assessed by calculation of percent recovery.

LCSs were generally analysed at a frequency of 1 in 20, with a minimum of one analysed per analytical batch.

Review of the entire laboratory QA/QC reports indicated that the percent recoveries for laboratory control samples were within the acceptance criteria except for the weeks listed in **Table D-5**.

**Table D-5: LCS non compliances**

Week	Analytes	Recovery (%)	Accepted limits (%)	ALS Comment	AECOM Conclusion
103	Antimony	85.2	87.7 – 114	Recovery less than lower control limit	Marginal under-estimation of concentrations – no adverse impacts on data quality
103	Arsenic	118	79.6 – 115	Recovery greater than upper control limit	Over-estimation of concentrations leading to more conservative approach – no adverse impact on data quality
106	Antimony	121	87.7 – 114	Recovery greater than upper control limit	Over-estimation of concentrations leading to more conservative approach – no adverse impact on data quality
	Arsenic	130	79.6 – 115		
	Cobalt	119	86.6 – 117		
	Lead	123	84.4 - 117		
	Molybdenum	126	89.6 – 110		
	Nickel	120	86.3 - 118		
106	Strontium	82.4	84.1 – 116	Recovery less than lower control limit	Marginal under-estimation of concentrations – no adverse impacts on data quality
107	Copper	122	85 – 117	Recovery greater than upper control limit	Over-estimation of concentrations leading to more conservative approach – no adverse impact on data quality
114	Antimony	123	87.7 – 114	Recovery greater than upper control limit	Over-estimation of concentrations leading to more conservative approach – no adverse impact on data quality
	Lead	124	84.4 - 117		
116	Total Alkalinity	118	77.5 – 112	Recovery greater than upper control limit	Over-estimation of concentrations leading to more conservative approach – no adverse impact on data quality
122	Acidity	105	95 – 105	Recovery greater than upper control limit	Over-estimation of concentrations leading to more conservative approach – no adverse impact on data quality
125	Fluoride	116	76 – 116	Recovery greater than upper control limit	Over-estimation of concentrations leading to more conservative approach – no adverse impact on data quality

Week	Analytes	Recovery (%)	Accepted limits (%)	ALS Comment	AECOM Conclusion
165	Chloride	81.3	90 – 110	Recovery less than lower control limit	Marginal under-estimation of concentrations – no adverse impacts on data quality
174	Chloride	82.7	90 – 110	Recovery less than lower control limit	Marginal under-estimation of concentrations – no adverse impacts on data quality

## 4.7 Matrix Spikes

Matrix spikes are samples prepared within the laboratory by dividing a field sample into two aliquots, then spiking each with identical concentrations of the analytes. The matrix spike and matrix spike duplicate are then analysed separately and the results compared to determine the effects of the sample matrix on the accuracy and precision of the analytes. Accuracy is assessed by the calculation of the percent recovery.

Review of the entire laboratory QA/QC reports indicated that the matrix spike recoveries were within the acceptance criteria except for the weeks listed in **Table D-6**.

**Table D-6 MS non compliances**

Week	Analytes	Recovery (%)	Accepted limits (%)	ALS Comment	AECOM Conclusion
105	Copper	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
106	Copper Manganese Zinc	Not determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
107	Copper	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
111	Chloride Manganese	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
112	Copper	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
113	Copper	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality

Week	Analytes	Recovery (%)	Accepted limits (%)	ALS Comment	AECOM Conclusion
116	Copper	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
119	Aluminium	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
120	Chloride	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
121	Manganese Fluoride	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
122	Chloride Aluminium Zinc	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
131	Manganese	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
148	Chloride	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
150	Chloride	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality
169	Copper	Not Determined	---	MS recovery not determined, background level greater than or equal to 4 times the spike level	Spike levels lower than actual target analyte concentration – under-estimation of concentrations unlikely - no adverse impact on data quality

## 4.8 Holding Times

NEPM (1999), APHA 21st Edition and AS2031.1-1986 recommend holding times for various analyses (under specified conditions, for example below 4°C in an airtight container), which must be met in order to consider the results valid. The holding times may vary slightly depending on the document referenced.

Review of all laboratory QA/QC reports indicated pH were consistently analysed outside the recommended holding time. However it does not have an adverse impact on the data quality as field pH were recorded and used in the calculations.

## 5.0 Data Validation

The overall assessment of the quality of the data obtained during this investigation is discussed below in terms of the data quality indicators provided in **Table D-7**.

**Table D-7: Data validation procedures**

DQI	Description	Compliance
Completeness	Completeness is a measure of the amount of usable data (expressed as %) from a data collection activity.	<p>The completeness of data is defined as the percentage of analytical results that are considered valid. Valid chemical data are values that have been identified as acceptable or acceptable as qualified during the data validation process. The completeness is a comparison of the total number of samples accepted against the total number of samples, calculated as a percentage. The project goal for completeness is 95%. Completeness also includes checking that all entries in the data tables are correct, properly entered, and that any typographical errors are corrected and the data are re-entered properly, as required.</p> <p><b>All samples collected and analysed complied with the DQIs, as such the data obtained are considered to be sufficiently quantitative and complete for the purposes of this investigation (i.e. &gt;95%)</b></p>
Comparability	Comparability is the confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event.	<p>Comparability expresses the confidence with which one data set can be compared with another. In order to assess comparability, sampling procedures, laboratory sample preparation procedures, analytical procedures, and reporting units must be known and similar to established protocols, as was the case during this investigation. Qualitatively, data subjected to strict QA/QC procedures will be deemed more reliable, and therefore more comparable, than other data.</p> <p>The sampling was conducted by an AECOM geoscientist or environmental technician in accordance with the standard sampling and analysis procedures. Each analyte was analysed by the same analytical laboratory using identical methods and laboratory LORs were consistent over each laboratory batch.</p> <p><b>Based on the above, the data obtained throughout the investigation are considered to be suitably comparable.</b></p>
Precision	Precision is a quantitative measure of the variability (or reproducibility) of data.	<p>Precision or variability of the data was assessed by determining RPDs between the original and duplicate samples analysed.</p> <p><b>Based on results discussed above, AECOM considers that the precision of the data are sufficient for the purposes of this investigation.</b></p>
Accuracy	Accuracy is a quantitative measure of the closeness of reported data to the true value.	<p>Accuracy of the data was assessed through review of the laboratory QA/QC results.</p> <p><b>Based on results discussed above, AECOM considers that the accuracy of the data are sufficient for the purposes of this investigation.</b></p>

Based on an assessment of field and laboratory QA/QC data, the reported analytical results are considered, by achievement of the DQIs, to be reliable and representative of concentrations of the compounds analysed in the leachates sampled.

## 6.0 Data Integrity

Errors of transcription between laboratory supplied data and the analysis spreadsheets were checked via a random selection of approximately 10% of all analytes. The original values from ALS reports for random weeks were transposed into a separate spreadsheet, then the coinciding values from the database were compiled alongside the ALS columns and each cell was compared for consistency. Data samples were taken from weeks 103 to 174. No discrepancies were found.
